5.1.9. Database	10

# Chapter 1

## 1.1. Project Description:

This project is to make an automated teller machine with the user's account number, pin number, and bank account. Using these credentials, users can deposit, withdraw and transfer funds.

## 1.2. Link to Github repository:

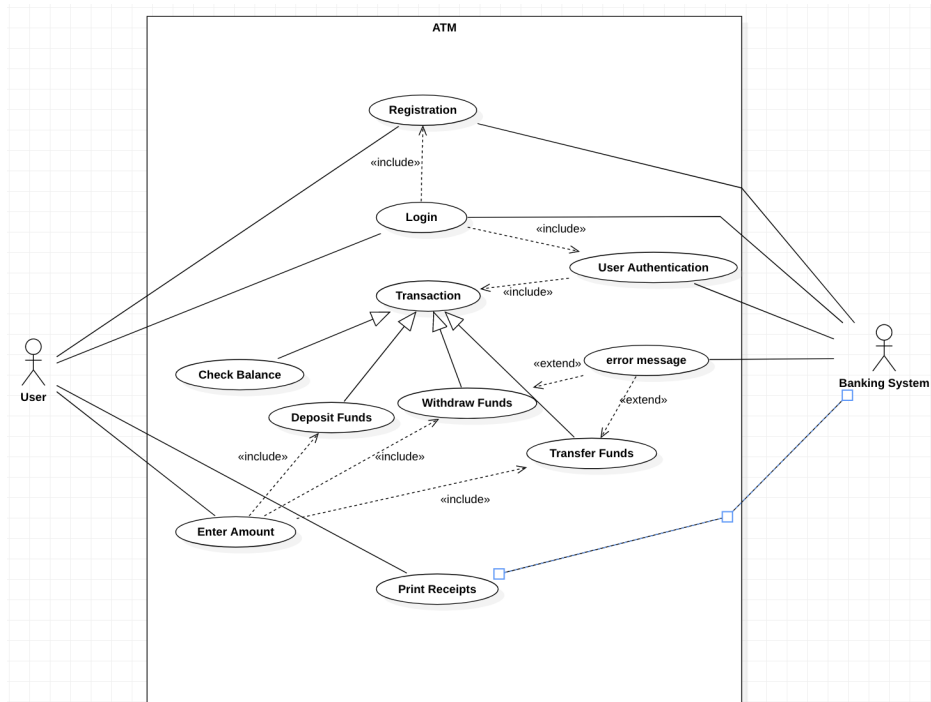

<https://github.com/riasingh12/ATM>

## 1.3. Features:

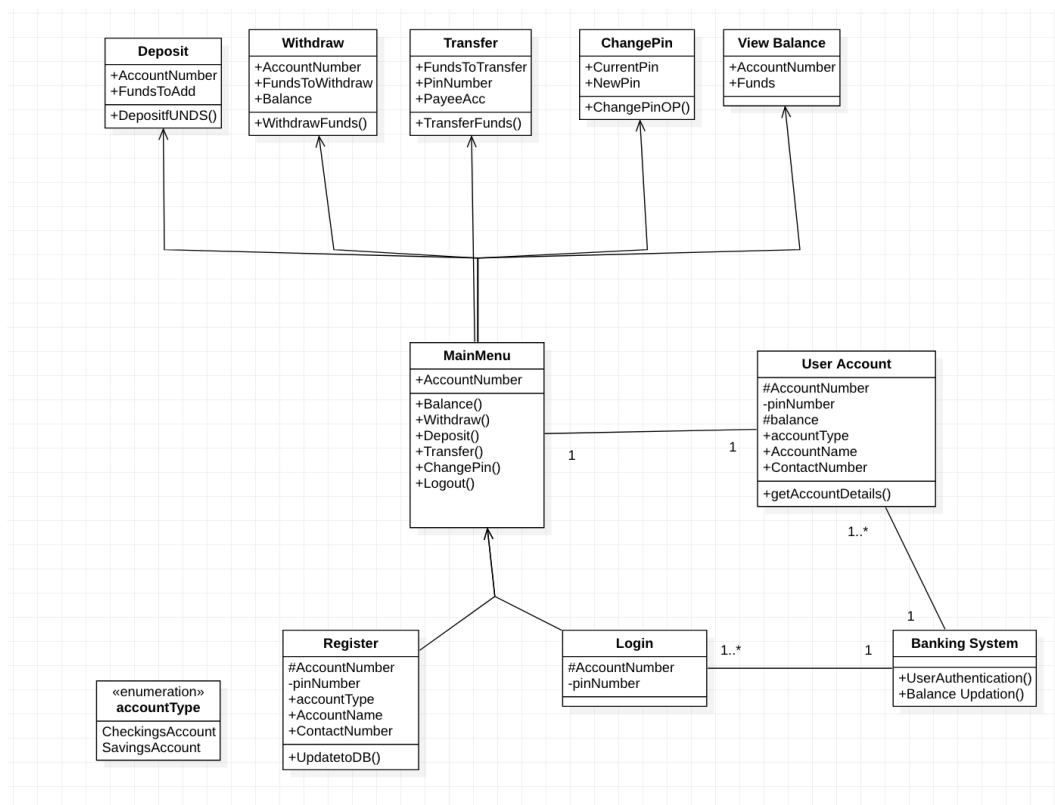

- User signup and login- Creating users along with their login credentials and storing them using files.
- Cash deposit- Enabling users to deposit cash into their accounts.
- Cash withdrawal- Allowing users to withdraw cash based on the amount present in the account.
- View balance- Users will be able to view their current balance before performing any actions.
- Transfer- Allowing transfer of funds from one user to another existing user.
- Change Pin- Allowing the user to change their account Pin.

# Chapter 2

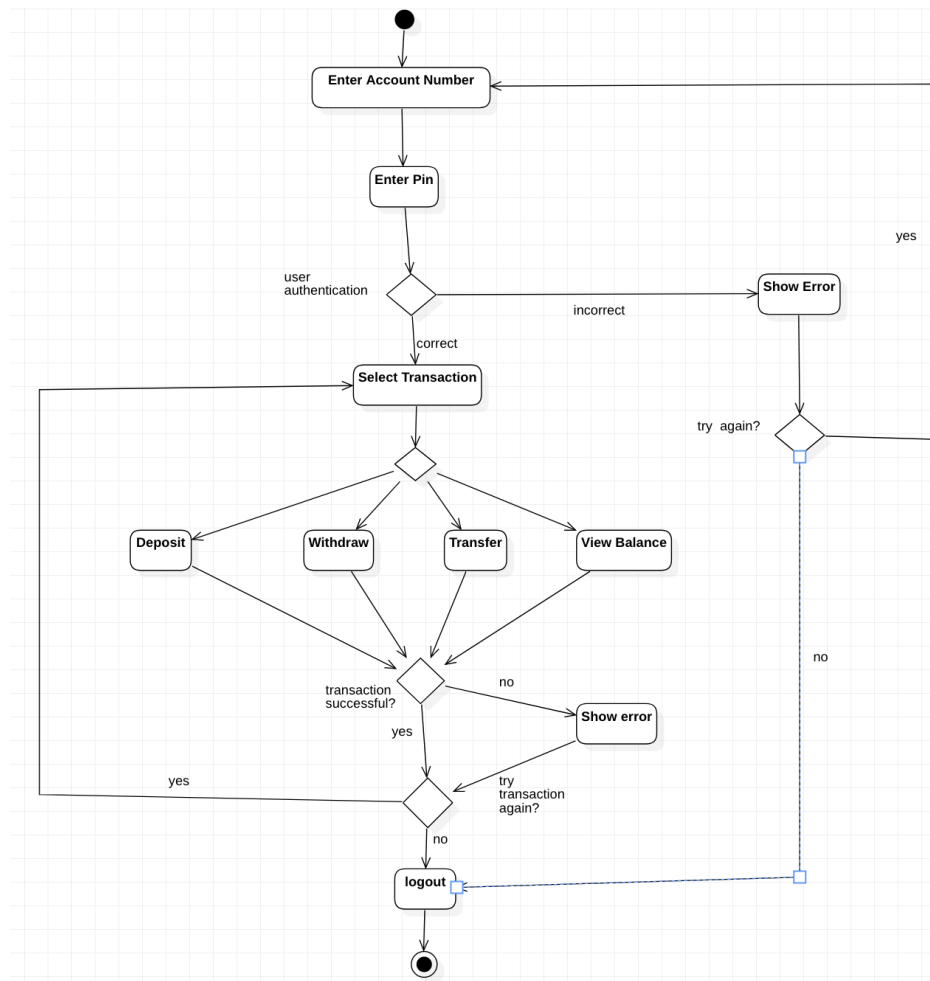

## 2.1. Analysis and Design Models

2.1.1. Use Case Diagram

2.1.2. Class Diagram

2.1.3. State Diagram

## **Chapter 3**

### **3.1. Tools and Frameworks Used**

Language: Java

Frontend: Swing, AWT

Database: SQL and PHP

IDE: Netbeans

## Chapter 4

### 4.1. Design Principles:

*Single Responsibility Function* is applied because each functionality of the ATM has its own class.

*Open-Close Principle* because if we need to add new functionality we can just extend by adding a new class for that functionality without needing to disrupt the existing classes.

### 4.2. Design Patterns:

*Behavioral Design Pattern:*

State- As our project is ATM where the click of a button and other event triggers cause changes in action, we have applied State as a design pattern that allows an object to alter its behavior when its internal state changes.

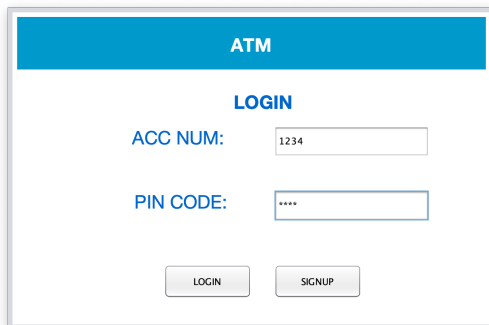

*Structural Design Pattern:*

Facade- This design pattern delegates client requests to appropriate subsystem classes which in turn implement those subsystem functionalities. In our ATM, we have implemented a “menu” that would call the functionalities as per the user’s request.

## Chapter 5

### 5.1. Application Screenshots (3-4 important pages)

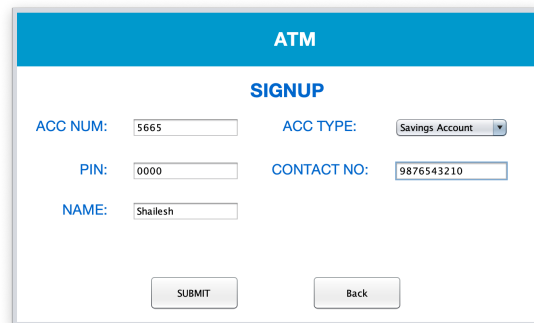

ATM

**LOGIN**

5.1.8. Withdraw Page

The screenshot shows the MySQL Workbench interface. The left sidebar displays the 'SCHEMAS' tree with 'ATMUser' selected. The main area shows a query window with the query 'SELECT \* FROM ATMUser.account'. Below the query window, the 'Result Grid' displays the following data:

AccNo	PIN	AccName	AccType	Cnum	funds
1234	5555	Ria	Savings	9889204514	1900
9876	9999	Ramit	Checkings Account	1234567890	0
5665	0	Shalish	Savings Account	9876543210	400

The bottom panel shows the 'Action Output' with the following log:

Time	Action	Response	Duration / Fetch Time
22:06:07	SELECT * FROM ATMUser.account LIMIT 0, 1000	1 row(s) returned	0.00059 sec / 0.000...
22:27:50	SELECT * FROM ATMUser.account LIMIT 0, 1000	3 row(s) returned	0.0016 sec / 0.00001...

5.1.9. Database

## Chapter 7

### 7.1. Team member contributions

SRN	Name	Contribution
PES2UG19CS307	R Shailesh	Deposit, Withdraw
PES2UG19CS319	Ramit Bathula	Login, Signup
PES2UG19CS326	Ria Singh	Transfer, Change Pin

*Frontend & Backend of each function was done by the respective member.*

## **Chapter 8**

### **7.1. Conclusion**

The ATM we have designed consists of multiple functionalities like deposit cash, withdraw cash, change pin, transfer funds, and view balance. We have also integrated structural and behavioral design patterns like facade and state respectively alongside the following two solid principles such as Single Responsibility and Open Close. This project was designed using swing for frontend, SQL via myphpadmin for backend on Netbeans IDE.
